

## This article is only valid for LB 4.04 and above

Some of you have already wondered how one would access the code backups on **Vista and above**. Below find a simple and effective solution.

1. Select **Setup => External Programs** from the editor menu bar
2. Hit the **New** button
3. Enter **Source Code Backups** as the program name
4. Now enter **explorer.exe /e,"\$USERDATAbak"** as the program file name
5. Close the dialog
6. Accept the notice about the editor needing a restart
7. Restart the editor

Now select **Run => Source Code Backups** from the editor menu bar.

You will be presented with an explorer window displaying the backups created automatically by the editor if you run or debug a program.

This is a quick way to find the last saved version of your last executed program, without the need to navigate through the folder structure of the hidden application data folder.
