Liberty BASIC Community Wiki

Hi. Be careful in here. Very shaky code in this corner. Most of these functions and subroutines represent my works in progress and although I'm quite happy (and probably flattered) for others to make use of them, I can't take any responsibility for these letting the smoke out of your machine! I am not that experienced a coder.

If you particularly like a certain snippet or think it would be generally useful, feel free to check, modify & / or correct it as necessary before posting it to the basic.wikispaces.com public shared code area.

These links all reference code stored on my own scratchpad space, scapegoat.wikispaces.com

- Function to fully qualify a 'local' filename
- Function to search a file for an enclosed pattern
- Subroutine to weed duplicates out of an array
- Subroutine to display the time in ms since execution began
